iRise Manager™

Visual RM for Business

iRise®
VISUALIZE. INNOVATE. DELIVER.™

iRise Manager is an easy-to-use Requirements Management (RM) solution used by business people to document, manage, trace and validate requirements in the context of application simulations.   For the first time, the power of application visualization is now integrated with comprehensive RM– taking the risk out of complex software projects and building confidence that the right application will get delivered on time, on budget and with all the features needed to succeed.

iRise Studio   iRise Manager
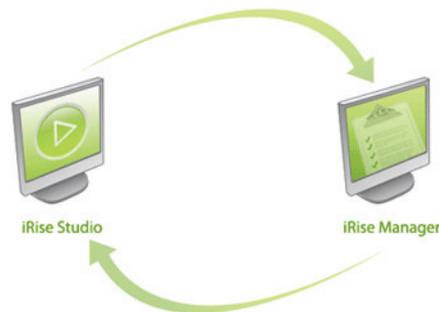

Detailed business requirements can be logged and tracked within the context of visual simulations.

Traditional RM tools are great for managing and controlling complex lists of text-based requirements, but have not eliminated the endemic project failures that have plagued IT organizations for decades.   Without associating requirements directly to visual representations of the application, it's impossible to know if you have the right requirements in the first place. And these tools were designed for engineers and developers, not for business people, making them extremely hard to learn and master.

iRise Manager solves this problem by putting comprehensive RM capabilities and control directly in the hands of the business. By linking text requirements directly to high-fidelity simulations of the proposed application, iRise Manager dramatically reduces the risk of requirements miscommunication, which eliminates rework, reduces requirements cycle time and ensures projects finish on time . The 'business friendly' interface to iRise Manager is easy to learn, yet powerful enough to tackle even the most complex application projects.

Benefits:

· Reduces risk of miscommunication through comprehensive requirements control linked to visual simulations

· Speeds change control with traceability & reporting

· Maintains compliance with audit trails

· Speeds requirements cycle time with collaboration

· Cuts wasted effort by reporting on orphan requirements

Fully integrated with the iRise simulation solution, and running completely within a Web browser, iRise Manager provides all the control and functionality needed for managing the complex set of requirements that make up today's business systems:

Audit Trails

Audit trails provide an unambiguous means for requirements compliance throughout the software development life cycle. Now you can track when a change is made to a requirement, who made it, and why.

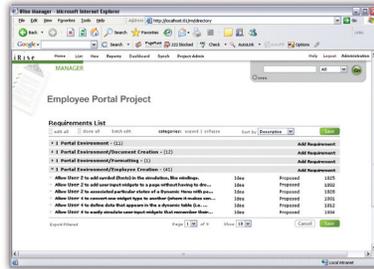

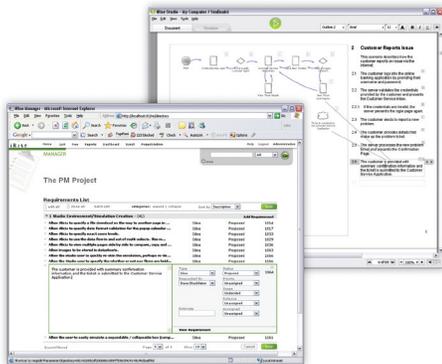

Traceability

The ability to link requirements to each other clarifies relationships and dependencies, eliminating potential confusion around conflicting requirements.

Requirements logging

Detailed text requirements can be linked to specific projects, users, versions and simulations, making change control a snap.

Communications

iRise Manager includes a convenient dashboard that shows urgent tasks, a blog that simplifies and encourages communication among participants and the ability to email contributors and stakeholders any late-breaking impacts and updates, speeding consensus on what to build.

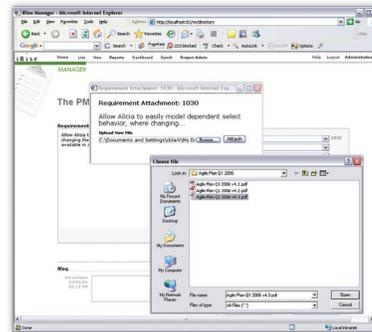

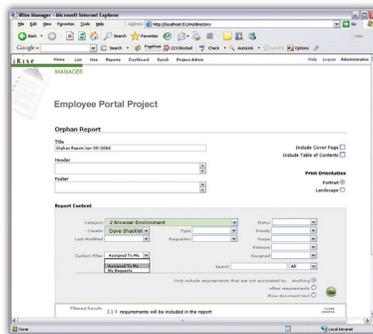

Control

A central repository, customizable filters for singling out specific requirements, full historical views and the ability to add files as attachments gives business people the ultimate in requirements control.

Reporting

Impact analysis and orphan reports provide quick summaries of critical items inside the complete requirement inventory, quickly identifying areas of concern.

"Managing requirements in connection with a working simulation just makes sense. Finally, my team controls all the requirements before we send it to out for development."
